Security Awareness Phishing Simulation
Capstone Project Report

1. Executive Summary
This project demonstrates a local security awareness simulation designed to teach users how to recognize common phishing indicators.

2. Objectives
- Understand common phishing techniques.
- Identify suspicious messages and links.
- Promote safe email and browsing habits.
- Demonstrate a simulated incident response process.

3. Scope
The project operates entirely in a local Kali Linux environment. No real phishing emails were sent.
No credentials or personal information were collected.

4. Tools and Technologies
- Kali Linux
- HTML, CSS and JavaScript
- Python HTTP Server
- Firefox
- Oracle VirtualBox

5. Methodology
A local awareness webpage was developed with a simulated security alert and an interactive button.
Clicking the button reveals common phishing warning signs and security recommendations.

6. Implementation
The webpage was hosted using Python's local HTTP server and accessed through Firefox at:

http://127.0.0.1:8000

7. Testing and Results
The webpage loaded successfully in Firefox.
The interactive button revealed the phishing warning signs as expected.

8. Incident Response
A simulated incident (INC-001) was documented.
The response records cover:
- Detection
- Containment
- Eradication
- Recovery
- Post-incident analysis

9. Findings
The simulation demonstrates several common phishing indicators:
- Unexpected security alerts
- Urgent or threatening language
- Suspicious links
- Requests for sensitive information

10. Mitigation Recommendations
- Verify the sender's email address.
- Avoid unexpected links and attachments.
- Never share passwords through email links.
- Report suspicious messages.
- Use multi-factor authentication.

11. Conclusion
The project successfully demonstrates a basic

```
phishing awareness exercise and a documented
simulated incident response workflow.

### 12. Evidence
Screenshots and supporting documentation are
available in the project repository.
